Komplikasyonlardan nasıl
kaçınabiliriz?

(Ağrı ve tekrarlama riskini artırmadan!)

- **Zımba kullanmalıyız**, ancak az sayıda ve büyük bir dikkatle.
- **Tespitlemeye gerek yoktur**, uygun boyutta yamayı iyi bir teknikle kullanıyorsanız.
- **Fibrin yapıştırıcı**, tekrarlama riskini artırmadan ağrı insidansını azaltan bir yöntem olarak uygundur

*«Tespiteleme yapalım mı
yapmayalım mı?”»*

Laparoscopic inguinal hernia repair without mesh fixation, early results of a large randomised clinical trial

Craig Taylor · Laurent Layani · Victor Liew · Michael Ghusn ·
Nic Crampton · Stephen White

Table 3 Incidence of new and persistent groin pain

	Fixation	No fixation	p value
Any new pain	38%	23%	0.0003
Pain score ≥ 2	22%	15%	0.049
≥ 3	16%	8%	0.009
≥ 4	2%	Nil	0.06

Conclusion

Mesh fixation appears to be unnecessary in TEP repair of small hernial defects. It is associated with higher operative costs and an increased likelihood of developing chronic groin pain. The omission of mesh fixation did not increase the risk of early hernia recurrence.

*500 fıtık, 2004-2006, prospektif çok merkezli çift kör randomize , TEP, 6-13 ay takip

*Tespitleme grubunda bir tekrarlama (%0.2)

*Tespitleme yapılmayan grupta hasta başına maliyette azalma 375 AUD

Randomized Prospective Study of Totally Extraperitoneal Inguinal Hernia Repair: Fixation Versus No Fixation of Mesh

Cody A. Koch, Susan M. Greenlee, RN, Dirk R. Larson, MS,
Jeffrey R. Harrington, MA, David R. Farley, MD

JSLS (2006)10:457–460

2002-2004, prospective randomized, two groups-- with or without tacking

Postoperative pain levels were lower in patients who did not receive mesh fixation ; however, the difference was not significant

No recurrence and no nerve injury

Conclusion: They recommended tackless endoscopic TEP inguinal hernia repair in selected patients.

Randomized Clinical Trial of Fixation vs Nonfixation of Mesh in Total Extraperitoneal Inguinal Hernioplasty

Germán Morales Cuenca, MD; José Luis Aguayo Albasini, MD

ARCH SURG/VOL 139, DEC 2004

COMMENT

efficient, as with anterior hernioplasties. Along this line, our study shows that hospital cost can be reduced by eliminating the routine use of mesh fixation. A suture gun in our center costs around €400; thus if in 2003 we operated on 116 inguinal hernias via laparoscopy, the cost of this item amounts to €46 600. By selecting patients in whom to fix the mesh, together with large-sized direct and bilateral cases (200 cases in 2003), we could create a considerable saving (€38 400/y). These data may be of great interest for departments planning to set up as clinical management units.

In conclusion, mesh fixation in the TEP technique offers no clinical advantages and increases the cost of the process. Our results recommend limiting the use of mesh fixation in the laparoscopic approach to cases of direct bilateral hernias.

Table 2. Morbidity of the 2 Groups of Patients Undergoing Surgery for Inguinal Hernia, According to Mesh Fixation*

Mesh Fixation	Total Extraperitoneal Laparoscopic Inguinal Hernioplasty		
	No (n = 85)	Yes (n = 85)	P Value
Anesthesia, general/spinal	57/28 (32.9)	72/13 (15.3)	.01
Operating time, min, mean ± SD			
Unilateral	39.1 ± 15.3	45.7 ± 17.9	.01
Bilateral	44.2 ± 22.6	50.5 ± 19.2	.05
Intraoperative morbidity	3 (3.5)	5 (5.9)	.36

Laparoscopic total extraperitoneal inguinal hernia repair with nonfixation of the mesh for 1,692 hernias

Pankaj Garg · Mahesh Rajagopal · Vino Varghese ·
Mohamed Ismail

Surg Endosc (2009) 23:1241–1245

	Mesh fixed (61 hernias/33 patients), n (%)	Mesh not fixed (1,692 hernias/896 patients), n (%)	p-Value
Operating time (min)	32.1 ± 8.5	30.2 ± 6.0	0.22, NS (<i>t</i> -test)
Conversion to open procedure	1 (3.03)	0	NS
Seroma formation	6/61 (9.8)	28/1652 (1.7)	0.0008 (Fisher's exact test)
Urinary retention	9 (27.3)	41 (4.6)	<0.0001 (Fisher's exact test)
Hospital stay (days)	1.35 ± 0.49	1.06 ± 0.25	<0.0001 (<i>t</i> -test)
Return to normal activities (days)	9.88 ± 3.3	7.59 ± 1.3	<0.0001 (<i>t</i> -test)
Pain at 1 month	8 (24.2)	30 (3.3)	<0.0001 (Fisher's exact test)
Recurrence	0	2 (0.2)	NS

ficult dissection or large defects. This could have led to a bias. However the prime purpose of the study was to show that TEP repair without mesh fixation is safe and associated with low recurrence rates. The technical points that must be given special care are adequate dissection, proper size of the mesh used, and accurate placement of the mesh in the preperitoneal space.

From the findings of this study, we can conclude with reasonable confidence that TEP inguinal hernia repair performed without mesh fixation is safe and feasible with minimal recurrence rates.

STAPLER

NO FIXATION

FİBRİN GLUE ?

Conclusions/ Suggestions

FS use is feasible.

Less pain, no increase of recurrence rate.

But it may have some **cost drawbacks**,
depending on

country, institution and insurance

No fixation in small (2cm) hernias may be recommended. It does not increase recurrence rate in this group.

Good technique/adequate size mesh

Less pain

most cost-effective

If there is a large hernia over 4 cm, you
should use staple fixation
(not enough evidence yet for no fixation)

But you should use only a few
(2-4) staples to avoid postoperative pain.
